1 Part A

1.1 Equation

$$y = e^x \quad (1)$$

$$y = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots \quad (2)$$

1.2 Graphs

1.2.1 First Order Polynomial

$y = e^x$ and First order Taylor Polynomial

Error

1.2.2 Second Order Polynomial

 $y = e^x$ and Second order Taylor Polynomial

Error

1.2.3 Third Order Polynomial

$y = e^x$ and Third order Taylor Polynomial

Error

1.3 Observations

1. The first order Taylor series expansion of $y = e^x$ is equal to 1. Hence, a straight line $y = 1$ is observed. Therefore, the error function is $y = e^x$ shifted by a single unit towards negative Y axis as demonstrated in the graph.
2. The second order Taylor series expansion of $y = e^x$ is equal to $1 + x$. Hence, a straight line $y = x$ is observed. Therefore, for values in the range $[0, 1]$, the error count decreases to almost zero whereas, increase in error can be observed for values greater than 1.
3. The third order Taylor series expansion of $y = e^x$ is $y = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!}$. Thus, the effect of quadratic term can be observed in the demonstrated results. The Taylor series expansion now starts to inhibit the properties of the function $y = e^x$ and so the error is decreased to zero for small values of x and for larger values of x it deviates.

2 Part B

2.1 Equation

$$y = \ln x \quad (3)$$

$$y = (x - 1) - \frac{(x - 1)^2}{2} + \frac{(x - 1)^3}{3} - \dots \quad (4)$$

2.2 Graphs

2.2.1 First Order Polynomial

$y = \ln x$ and First order Taylor Polynomial

Error

2.2.2 Second Order Polynomial

$y = \ln x$ and Second order Taylor Polynomial

Error

2.2.3 Third Order Polynomial

$y = \ln x$ and Third order Taylor Polynomial

Error

2.3 Observations

1. The first order Taylor series expansion of $\ln x$ is equal to $x - 1$. Hence, a straight line $y = x - 1$ is observed. Therefore, for values near $x = 1$, the error count is very low whereas for values far from $x = 1$, increase in error can be observed.
2. The second order Taylor series expansion of $\ln x$ is equal to $y = (x - 1) - \frac{(x-1)^2}{2}$. For $x \in [0, 1]$, $x - 1$ term dominates but for larger values of x i.e. $x > 1$ the negative quadratic term dominates and so the curve of p_2x shifts "downwards" and error increases continuously.
3. The third order Taylor series expansion of $\ln x$ is $y = (x - 1) - \frac{(x-1)^2}{2} + \frac{(x-1)^3}{3}$. For $x \in [0, 1]$, $x - 1$ term dominates but for larger values of x now the positive cubic term dominates over negative quadratic term and so the curve of $p_2(x)$ shifts "upwards" and error increases.

3 Part C

3.1 Equation

$$y = \sin x \quad (5)$$

$$y = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \dots \quad (6)$$

3.2 Graphs

3.2.1 First Order Polynomial

$y = \sin x$ and First order Taylor Polynomial

Error

3.2.2 Second Order Polynomial

$y = \sin x$ and Second order Taylor Polynomial

Error

3.2.3 Third Order Polynomial

$y = \sin x$ and Third order Taylor Polynomial

Error

3.3 Observations

1. The first order Taylor series expansion of $\sin x$ is equal to x . Hence, a straight line $y = x$ is observed. Therefore, for values near $x = 0$, the error count is very low whereas for values of $x > 1$, larger positive or negative values of error can be observed.
2. The second order Taylor series expansion of $\sin x$ is equal to x . Hence, same results as in the case of first order Taylor series can be observed.
3. The third order Taylor series expansion of $\sin x$ is equal to $x - \frac{x^3}{3!}$. Thus, the effect of cubic term being subtracted from x can be observed in the shown results. The Taylor series expansion now starts to inhibit the properties of $\sin x$ and so the error is decreased in the $x \in [-\pi, \pi]$ drastically as compared to the first two cases but after that the error increases as the Taylor Polynomial deviates from $\sin x$.

4 Part D

4.1 Equation

$$y = \cos x \quad (7)$$

$$y = 1 - \frac{x^2}{2!} + \frac{x^3}{3!} - \dots \quad (8)$$

4.2 Graphs

4.2.1 First Order Polynomial

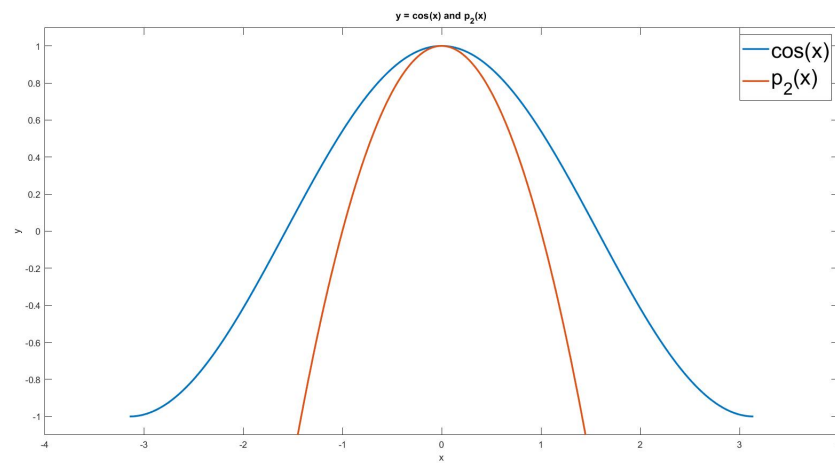

$y = \cos x$ and First order Taylor Polynomial

Error

4.2.2 Second Order Polynomial

$y = \cos x$ and Second order Taylor Polynomial

Error

4.2.3 Third Order Polynomial

$y = \cos x$ and Third order Taylor Polynomial

Error

4.3 Observations

1. The first order Taylor series expansion of $\cos x$ is equal to 1. Hence, a straight line $y = 1$ is observed. Therefore, the error function is the $\cos x$ curve shifted by a single unit towards negative Y axis as demonstrated in the graph.
2. The second order Taylor series expansion of $\cos x$ is equal to $1 + \frac{x^2}{2!}$. Thus, the effect of quadratic term can be observed in the demonstrated results. The Taylor series expansion now starts to inhibit the properties of $\cos x$ for values of x near to $x = 0$ and so the error is decreased near the values of x close to zero.
3. The third order Taylor series expansion of $\cos x$ is also equal to $1 + \frac{x^2}{2!}$. Hence, same results as in the case of second order Taylor series can be observed.
